

Computation of generalized aspect of parallel manipulators

Daisuke Ishii, Christophe Jermann, and Alexandre Goldsztejn

CNRS - University of Nantes

Generalized aspects are singularity-free connected components of robots workspace. Since avoiding singularities is mandatory when using a robot, their computation is critical for the analysis of robot workspaces. We present a rigorous algorithm based on numerical constraint resolution for the rigorous computation of these generalized aspects that requires no preliminary geometrical analysis of the robot. Preliminary experiments will be presented.
